

Activity variability and motor impairment

preDLB vs HC | Common adjusted GEE slope

Pooled discovery: $\rho=0.331$, FDR $p=0.0135$. Adjusted GEE FDR $p=1.31e-05$; interaction FDR $p=0.614$. Covariates: gender, education; 113 people. Continuous covariates are held at their means. Gender is held at the reference level. Thin lines connect repeated visits from the same person.
