

Nocturnal awakening variability and executive performance

Pooled discovery: $\rho = -0.324$, FDR $p = 0.00709$. Adjusted GEE FDR $p = 0.0168$; interaction FDR $p = 0.969$. Covariates: gender, education; 116 people. Continuous covariates are held at their means. Gender is held at the reference level. Points are separated slightly on the x-axis to reveal overlapping diagnoses; model lines use the original values. Thin lines connect repeated visits from the same person.
